Guidelines

Page Header & navigation

## Headline

When the image source is unavailable (for example, when there's a problem displaying the image due to an error), or the source is unspecified, the avatar component will display a default image.

Showcase area

## Headline

Avoid using disabled UI. This can cause accessibility problems, because disabled UI doesn't give enough information to the user about what went wrong and how to proceed, and will not appear in the tab order.

# Components

Components are the reusable building blocks of our design system. Each component meets a specific interaction or UI need, and has been specifically created to work together to create patterns and intuitive user experiences.

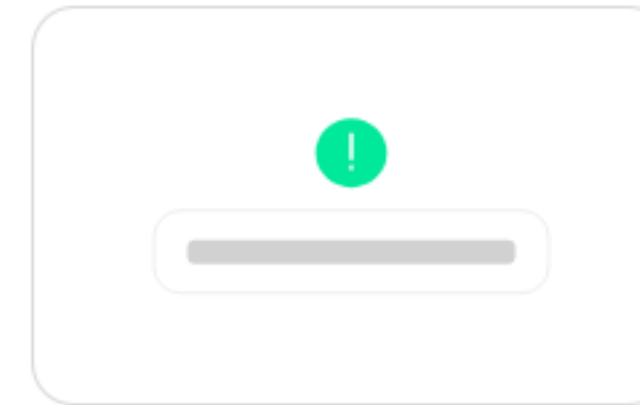

### Accordion

Accordion is a vertically stacked list of headers that allows users to reveal or hide related sections of content.

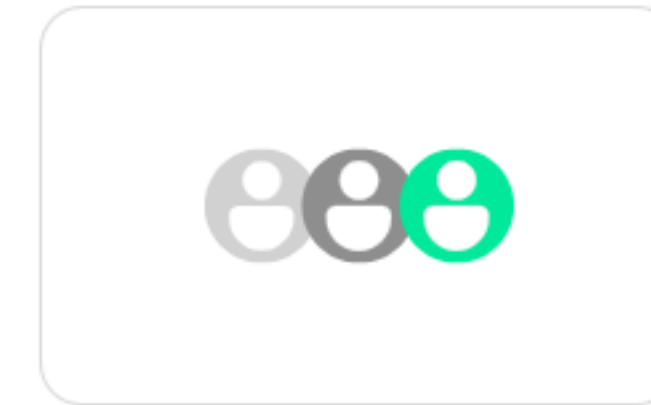

### Action Sheet

Action Sheet is a context menu that overlays content, requires manual dismissal, and offer related choices to the current context

### Alert

Alert is the most urgent notification, demanding immediate attention and persisting until dismissed by the user. It conveys important information and warnings

### Avatar

Avatar is a circular component that visually represents a user or object, utilizing images, icons, or text/initials for clear identification
